

NWODU ROBERT

IT Security Analyst | Cybersecurity & SOC Operations

+234 803 345 7468 | Chimuanyanwodu200@gmail.com | Nigeria (Remote) | github.com/Robertnile | linkedin.com/in/robertchimuanwodu

PROFESSIONAL SUMMARY

Results-oriented IT Security Analyst with hands-on experience monitoring security tools, analyzing threats, and responding to incidents in self-built enterprise-grade lab environments. Proficient in SIEM platforms (Splunk), IDS/IPS, threat hunting (Velociraptor), network traffic analysis (Zeek, Wireshark), and attack simulation — all mapped to the MITRE ATT&CK framework. Experienced in vulnerability assessment workflows, log analysis (Windows/Linux), risk documentation, and IR playbook authoring following PICERL. Trained in cybersecurity operations at Luke Tech Limited (Canada, remote). Currently pursuing CompTIA Security+ and ISC2 CC. Seeking a fully remote IT Security Analyst role.

TECHNICAL SKILLS

SIEM & Log Analysis: Splunk Enterprise, Splunk Universal Forwarder, SPL query writing, Zeek (conn.log, dns.log, http.log), Postfix/auth.log, Windows Event Logs

IDS/IPS & Network Security: Zeek (network IDS), Wireshark (packet analysis), TCP/IP, DNS, HTTP/HTTPS, SMTP, firewall concepts, VPN fundamentals

Threat Hunting & DFIR: Velociraptor, VQL (custom artifact authoring), MITRE ATT&CK mapping, IOC analysis, incident triage

Vulnerability & Risk Assessment: Nmap (port/service enumeration), attack simulation (Kali Linux, Metasploit), risk documentation, mitigation recommendations

Incident Response: IR playbook authoring (PICERL framework), alert tuning, Splunk dashboards, phishing forensics, credential compromise analysis

Operating Systems: Linux (Ubuntu, Kali), Windows 11, VirtualBox, VM network configuration

Security Concepts: Phishing simulation, brute force detection, privilege escalation, C2 traffic analysis, SPF/DKIM/DMARC, email header analysis

Scripting (Basic): Bash scripting for lab automation; VQL (Velociraptor Query Language) for custom detection artifacts

Compliance Awareness: MITRE ATT&CK framework, PICERL incident response model, security policy documentation

PROJECTS & LABS

Phishing Attack Simulation & Detection Lab | Personal Project

2026 – Present

github.com/Robertnile/phishing-simulation-lab

- Deployed a full-stack phishing simulation lab (4 VMs: Kali, Ubuntu Server, Windows 11, Splunk) to practice both attacker and defender roles — replicating a real security operations workflow.
- Configured GoPhish (attacker) and Mailhog (mail catcher) to safely simulate phishing campaigns; crafted a social-engineered IT Support email with a fake credential-harvesting landing page.
- Captured cleartext credentials in Wireshark POST requests and identified the X-Server: gophish IOC — demonstrating hands-on incident investigation and evidence collection.
- Forwarded Zeek HTTP logs and Postfix mail logs to Splunk via Universal Forwarder; wrote SPL detection queries, built a Phishing Attack Analysis dashboard, and mapped findings to MITRE ATT&CK (T1566.002, T1056.003, T1071.001).
- Performed email header forensics comparing SPF/DKIM/DMARC failures between phishing and legitimate emails — directly aligned with real-world phishing analysis responsibilities.

Velociraptor Threat Hunting & DFIR Lab | Personal Project

2026 – Present

github.com/Robertnile/velociraptor-threat-hunting-lab

- Deployed Velociraptor as a DFIR platform across Windows 11 and Ubuntu 24.04 VMs; simulated 11 real-world attack techniques including credential dumping, lateral movement, persistence, and C2 communication.

- Authored custom VQL (Velociraptor Query Language) artifacts for each attack technique — demonstrating detection engineering beyond default built-in queries.
- Produced a full remediation table with countermeasures and a lessons-learned write-up reflecting SOC analyst methodology, supporting risk assessment and mitigation documentation.

Splunk SIEM Lab — Metasploitable3 Attack Detection | Personal Project 2026 – Present

github.com/Robertnile/splunk-metasploitable-lab

- Built a 3-VM SIEM environment (Splunk, Kali attacker, Metasploitable3 victim); ingested auth.log/syslog in real time and deployed Zeek for network-level visibility.
- Simulated Nmap recon (T1046), SSH brute force (T1110.001), reverse shell C2 (T1571), and privilege escalation (T1136.001); wrote SPL detection queries and Splunk real-time alerts for all four scenarios.
- Created a Linux Account and Privilege Monitoring dashboard — reflecting real SOC monitoring and reporting responsibilities.

WORK EXPERIENCE

SOC Analyst Trainee | Luke Tech Limited | Canada (Remote) 2025

- Completed practical SOC training covering threat detection, SIEM configuration, incident response fundamentals, and cybersecurity operations.
- Developed hands-on proficiency with security monitoring tools and workflows applicable to enterprise environments.

IT Support Technician | Edu Business Center | Nigeria Prior

- Provided hardware/software troubleshooting, managed user accounts, system configurations, and basic network connectivity — building foundational IT operations experience.

EDUCATION & CERTIFICATIONS

Secondary School Certificate — Comprehensive Secondary School, Nigeria

Certifications In Progress:

- CompTIA Security+ (in progress)
- ISC2 CC — Certified in Cybersecurity (in progress)
- TryHackMe SOC Level 1 (in progress)

GITHUB PORTFOLIO

All projects publicly available at github.com/Robertnile — each repository includes full documentation, MITRE ATT&CK mapping, detection queries, Splunk dashboards, and remediation guidance.
