PROFESSIONAL SUMMARY

Analytical and hands-on **IT Security Analyst** with practical experience in threat detection, SIEM log monitoring, malware analysis, and incident response within enterprise-grade lab environments. Skilled in leveraging **Splunk**, **Velociraptor**, **Zeek**, and **REMnux** to perform behavioral detection engineering, C2 identification, and root-cause investigation mapped to the **MITRE ATT&CK framework**. Adept at authoring standard operating procedures and **PICERL IR playbooks** to optimize SOC incident Workflows.

TECHNICAL SKILLS

SIEM & Log Monitoring:	Splunk Enterprise, Splunk Universal Forwarder, S P L Query Authoring, Zeek (conn/dns/http/ssl logs), Windows Event Logs, Syslog
Threat Hunting & DFIR:	Velociraptor, VQL Artifact Engineering, Behavior-based Detection, IOC Extraction, Incident Triage, PICERL IR Playbooks
Malware & Network Analysis:	REMnux (Static Analysis), Hybrid Analysis, VirusTotal, Wireshark Packet Forensics, DNS/HTTPS C2 Detection, Dropper Deobfuscation
Vulnerability & SecOps:	Nmap, GoPhish, Phishing Forensics (SPF/DKIM/DMARC), Metasploit Attack Simulation, Kali Linux, Linux/Windows Admin
OS & Virtualisation:	Linux (Ubuntu, Kali, REMnux), Windows 11, VirtualBox, multi-VM network configuration
Security Concepts:	DNS tunneling, JavaScript dropper analysis, WMI-based evasion, behavioral vs. signature detection, SPF/DKIM/DMARC, brute force/privilege escalation detection
Scripting:	Bash (lab automation), VQL (Velociraptor custom artifacts)

TECHNICAL PROJECTS & THREAT DETECTION LABS

CASE-005 — AgentTesla JavaScript Dropper Analysis Jul 2026 – Present

github.com/Robertnile/case-005-agenttesla-js-dropper

- ▶ **Static analysis** of a 65,573-line obfuscated JS dropper on REMnux — identified junk switch/case obfuscation (T1027, T1497) designed to exhaust sandbox timeouts and evade AV.
- ▶ **Extracted and decoded** a Base64-encoded C2 URL disguised as a PNG image using grep and base64 — bypassed proxy content inspection (T1036, T1105).
- ▶ **Traced full WMI execution chain:** PowerShell assembled in memory → stored in environment variable → WMI spawns hidden process (ShowWindow=0) — mapped T1047, T1564.003, T1059.001.
- ▶ **Identified persistence via Startup folder self-copy and LOLBin abuse** (caspol.exe contacting ip-api.com for geolocation pre-delivery) — T1547.001, T1016.
- ▶ **Submitted to Hybrid Analysis and VirusTotal** — Threat Score 100/100, 31/60 engines flagged; dynamic analysis revealed a second payload URL missed during static analysis, validating multi-method approach.

CASE-004 — Tunneling in Plain Sight: DNS & HTTPS C2 Detection Jun 2026 – Present

github.com/Robertnile/Tunneling-in-Plain-Sight-Detecting-DNS-C2-with-Zeek-and-Splunk

- ▶ **Simulated DNS tunneling (dnscat2) and HTTPS C2 (Meterpreter)** — achieved root shell over both channels with no direct TCP/UDP in the DNS attack and fully encrypted HTTPS traffic.
- ▶ **Built six behavioral SPL detections** across both protocols (unusual DNS record types, encoded query length, high-volume rate, self-signed TLS cert, repeated beaconing) — same methodology caught both C2 channels despite different tools, ports, and log sources.
- ▶ **Discovered and documented a critical Zeek/Splunk props.conf parsing bug** (FIELD_HEADER_REGEX) affecting all Zeek sourcetypes — now a required fix referenced in subsequent cases.

CASE-003 — Phishing Attack Simulation & Detection

Apr 2026 — Present

github.com/Robertnile/phishing-simulation-lab

- ▶ **Deployed full-stack phishing lab** (4 VMs: Kali, Ubuntu Server, Windows 11, Splunk) replicating real SOC attacker-vs-defender workflow using GoPhish and MailHog.
- ▶ **Captured cleartext credentials in Wireshark POST requests** and identified the X-Server: gophish IOC; forwarded Zeek HTTP and Postfix logs to Splunk via Universal Forwarder.
- ▶ **Wrote SPL detection queries and built a Phishing Attack Analysis dashboard** — mapped T1566.002, T1056.003, T1071.001; performed email header forensics comparing SPF/DKIM/DMARC failures.

CASE-002 — Velociraptor Threat Hunting & DFIR Lab

Mar 2026 — Present

github.com/Robertnile/velociraptor-threat-hunting-lab

- ▶ **Deployed Velociraptor across Windows 11 and Ubuntu 24.04** — simulated 11 real-world attack techniques including credential dumping, lateral movement, persistence, and C2 communication.
- ▶ **Authored custom VQL artifacts for each technique** — demonstrating detection engineering capability beyond default built-in queries; produced full remediation table and lessons-learned write-up.

CASE-001 — Splunk SIEM Lab: Metasploitable3 Attack Detection

Feb 2026 — Present

github.com/Robertnile/splunk-metasploitable-lab

- ▶ **Built 3-VM SIEM environment** (Splunk, Kali, Metasploitable3) with real-time auth.log/syslog ingestion and Zeek for network-level visibility.
- ▶ **Simulated four attack chains** — Nmap recon (T1046), SSH brute force (T1110.001), reverse shell C2 (T1571), privilege escalation (T1136.001) — wrote SPL detections and real-time alerts for all four.
- ▶ **Authored four IR playbooks (PB-001–004)** following the PICERL framework; built a Linux Account and Privilege Monitoring dashboard.

WORK EXPERIENCE

SOC Analyst Trainee

October 2025 — Present

[Luke Tech Limited — Canada \(Remote\)](#)

- Monitored security telemetry and conducted initial alert triage for threat detection, SIEM configuration, and response readiness.
- Executed SOC operational workflows, investigating suspicious endpoint activity and verifying network indicators of compromise (IOCs).
- Documented investigation findings, escalating validated security events following structured incident response protocols.

IT Support Technician

February 2023 — May 2025

[Edulinks Business Ventures — Nigeria](#)

- Managed system administration, hardware/software troubleshooting, and user identity management for organizational network users.
- Maintained network security standards, system patches, and basic firewall rules to preserve operational continuity.

CERTIFICATIONS & TRAINING

- **CompTIA Security+** (In Progress — Target Completion: September 2026)
- **ISC2 Certified in Cybersecurity (CC)** (In Progress — Target Completion: October 2026)
- **TryHackMe SOC Level 1 Learning Path** (In Progress)

PORTFOLIO

Full case-study write-ups and live project demos at robertnile.github.io. All source repositories at github.com/Robertnile — each includes full documentation, MITRE ATT&CK mapping, detection queries, and remediation guidance.
